Lecture Outlines

## Chapter 5

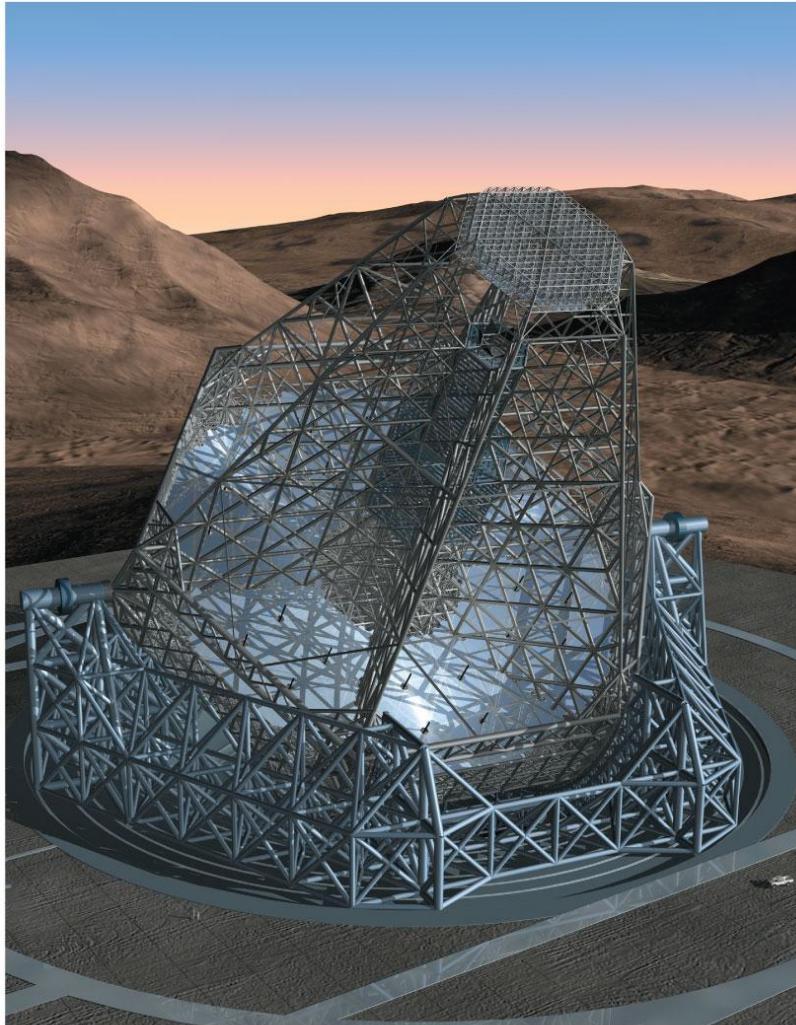

*Astronomy Today*

*7th Edition*

Chaisson/McMillan

# Chapter 5

# Telescopes

# Units of Chapter 5

## 5.1 Optical Telescopes

The *Hubble Space Telescope*

## 5.2 Telescope Size

## 5.3 Images and Detectors

## 5.4 High-Resolution Astronomy

## 5.5 Radio Astronomy

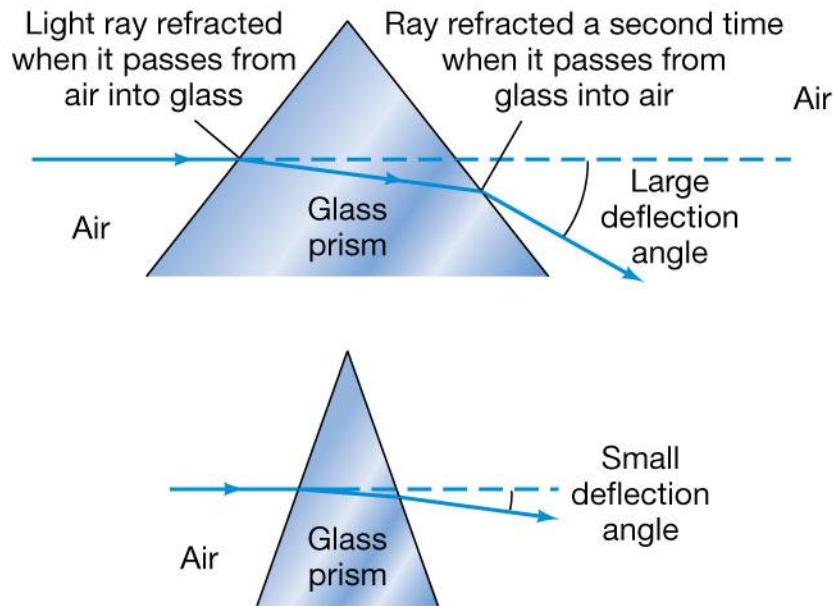

## 5.6 Interferometry

## 5.7 Space-Based Astronomy

## 5.8 Full-Spectrum Coverage

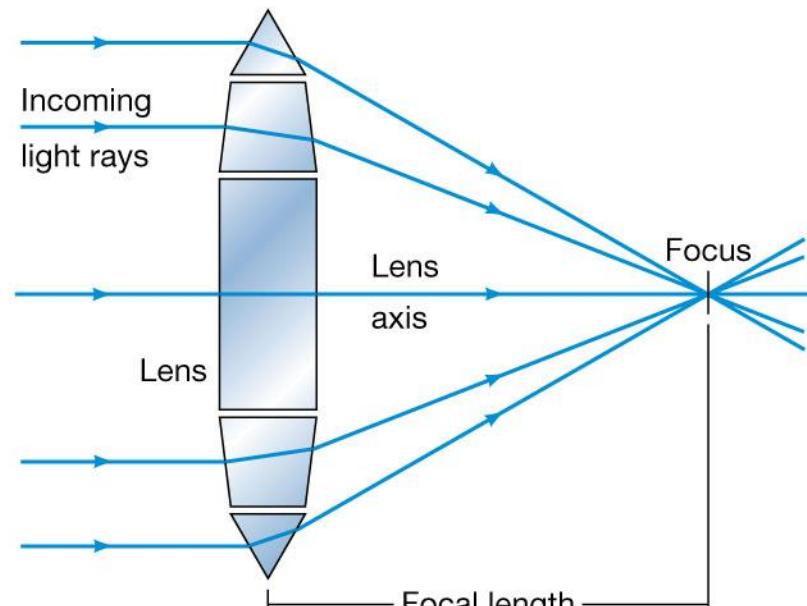

# 5.1 Optical Telescopes

## Refracting lens

(a)

© 2011 Pearson Education, Inc.

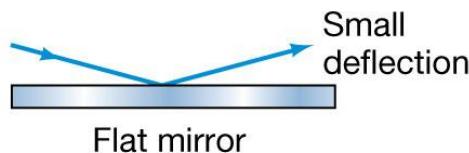

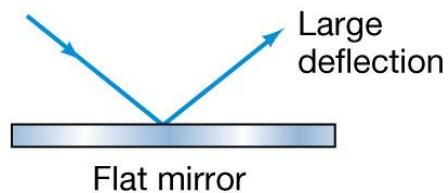

(b)

# 5.1 Optical Telescopes

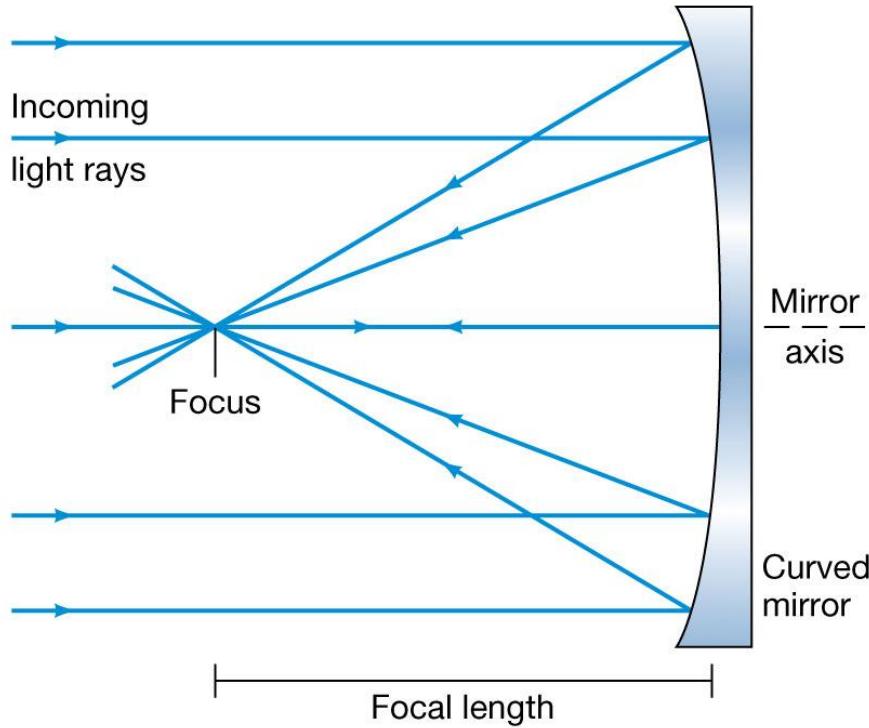

Images can be formed through reflection or refraction

## Reflecting mirror

(a)

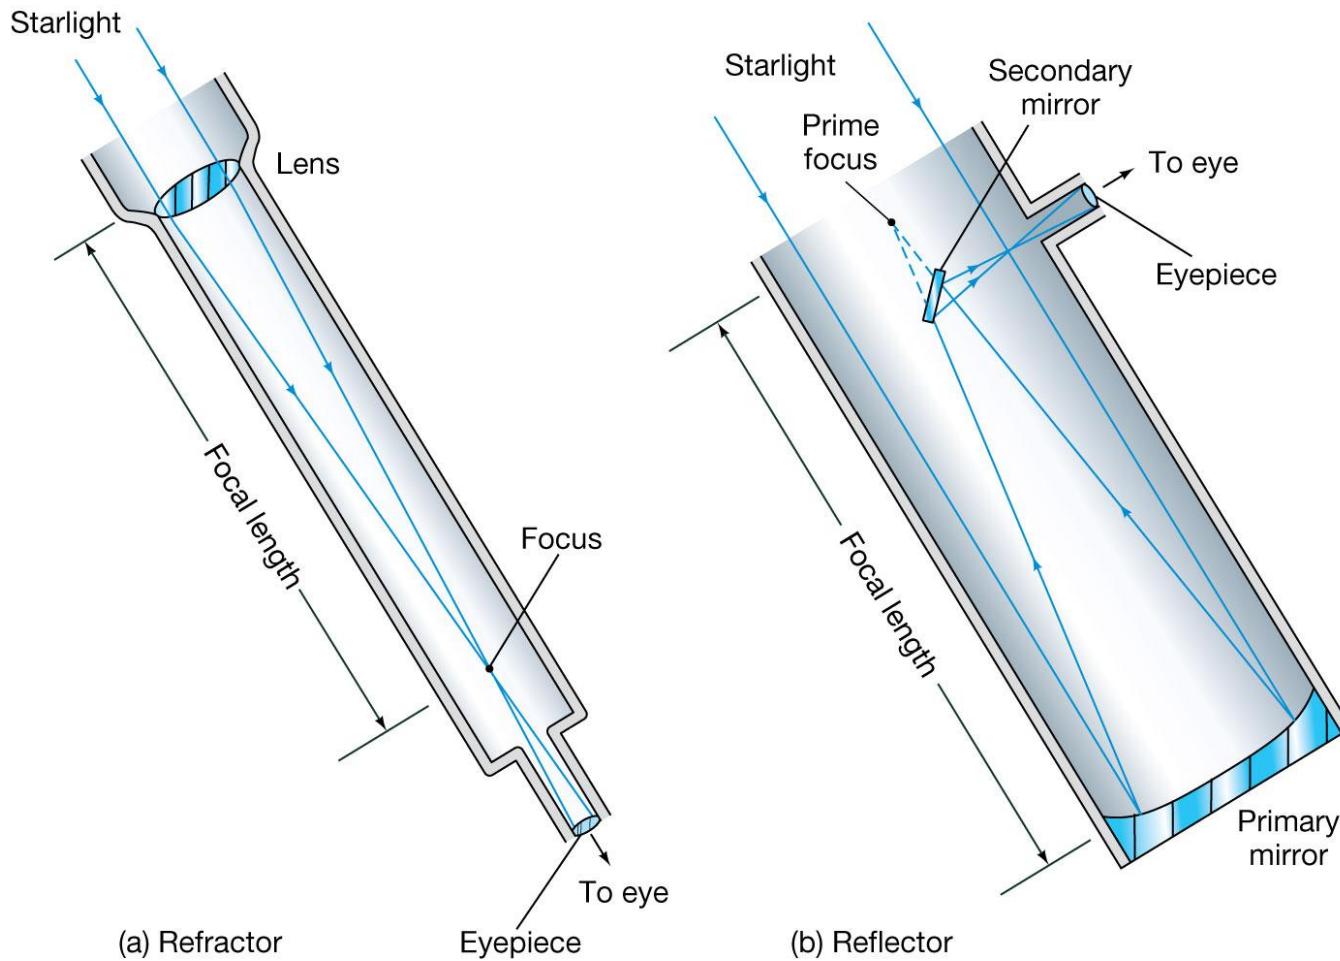

© 2011 Pearson Education, Inc.

(b)

# 5.1 Optical Telescopes

## Reflecting and refracting telescopes

© 2011 Pearson Education, Inc.

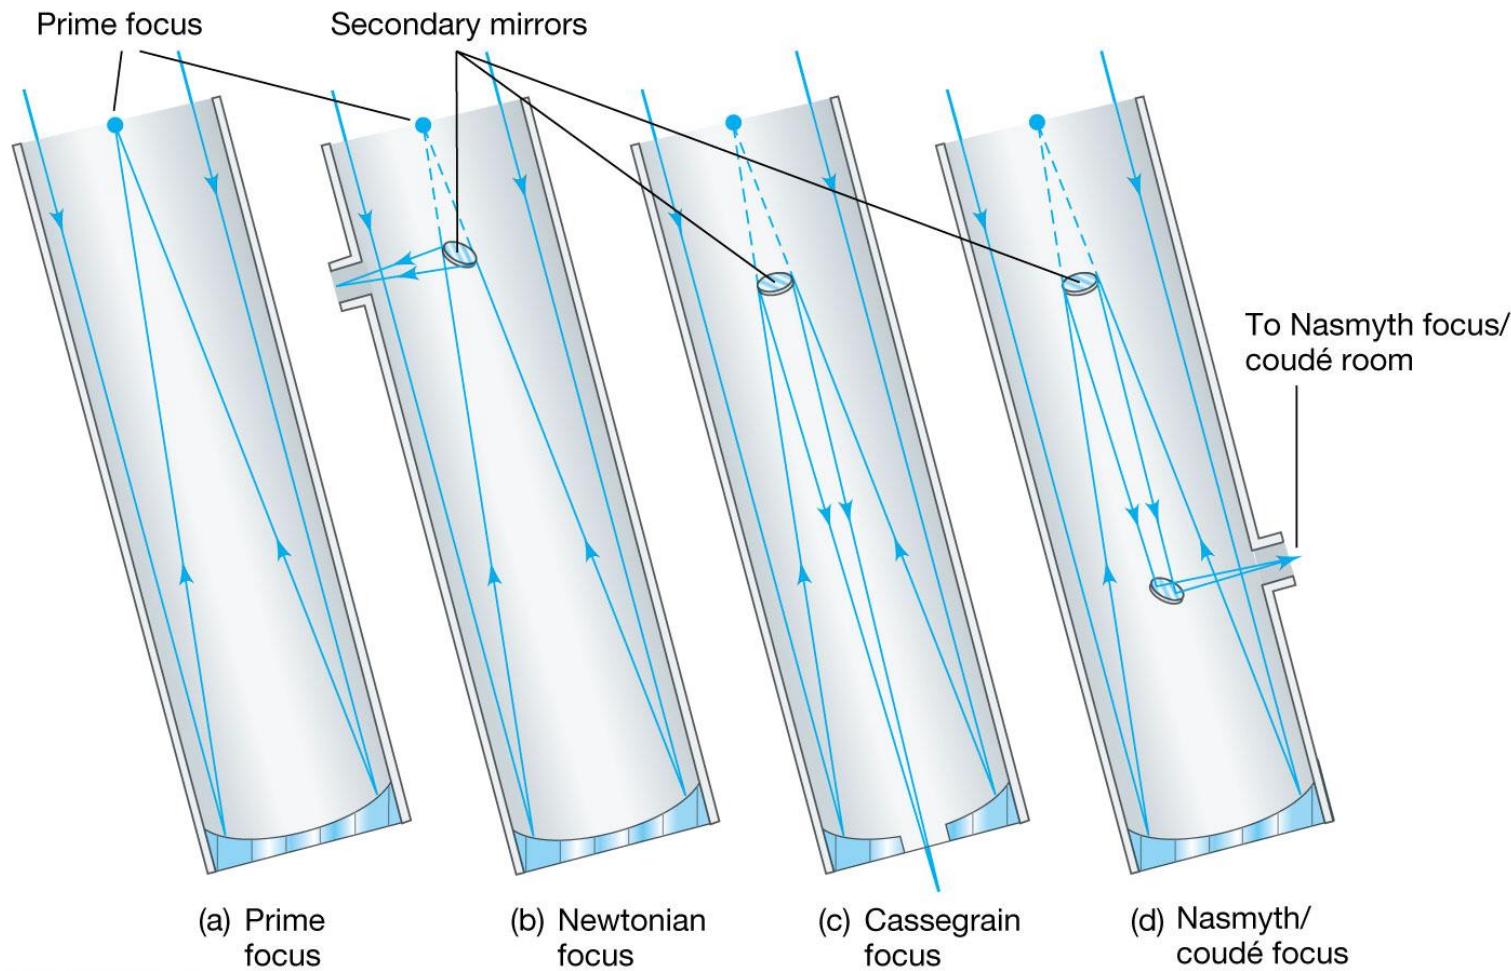

# 5.1 Optical Telescopes

**Modern telescopes are all reflectors:**

- Light traveling through lens is refracted differently depending on wavelength
- Some light traveling through lens is absorbed
- Large lens can be very heavy, and can only be supported at edge
- A lens needs two optically acceptable surfaces; mirror needs only one

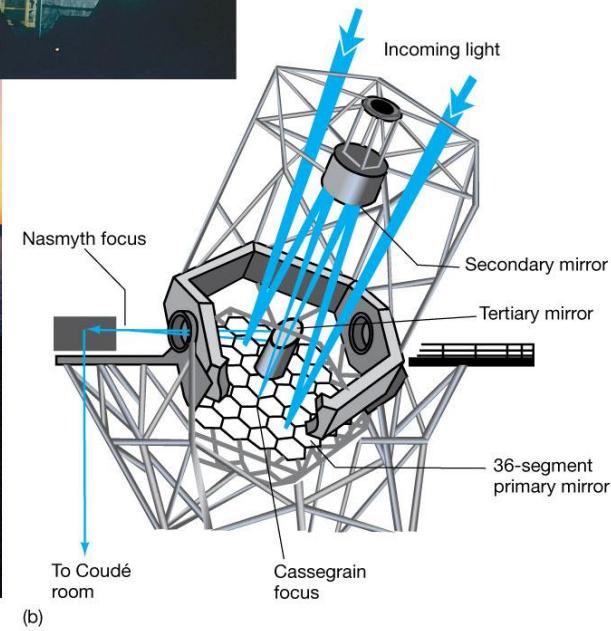

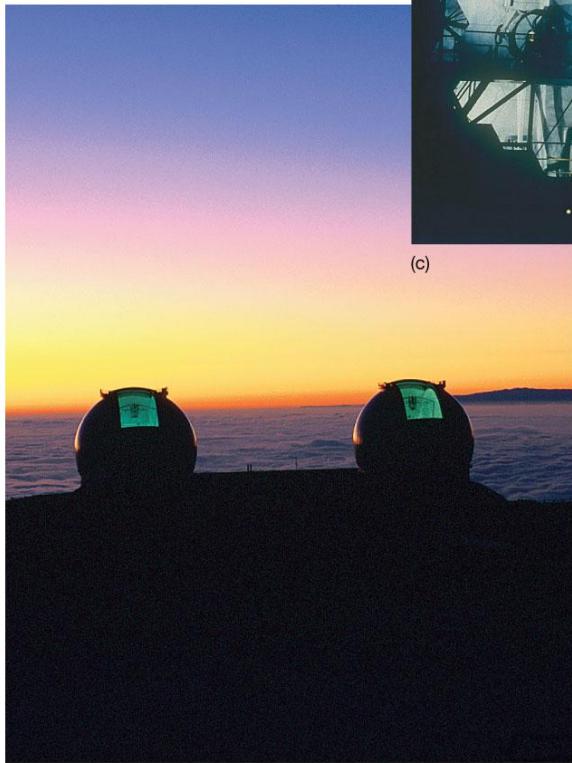

# 5.1 Optical Telescopes

## Types of reflecting telescopes

# 5.1 Optical Telescopes

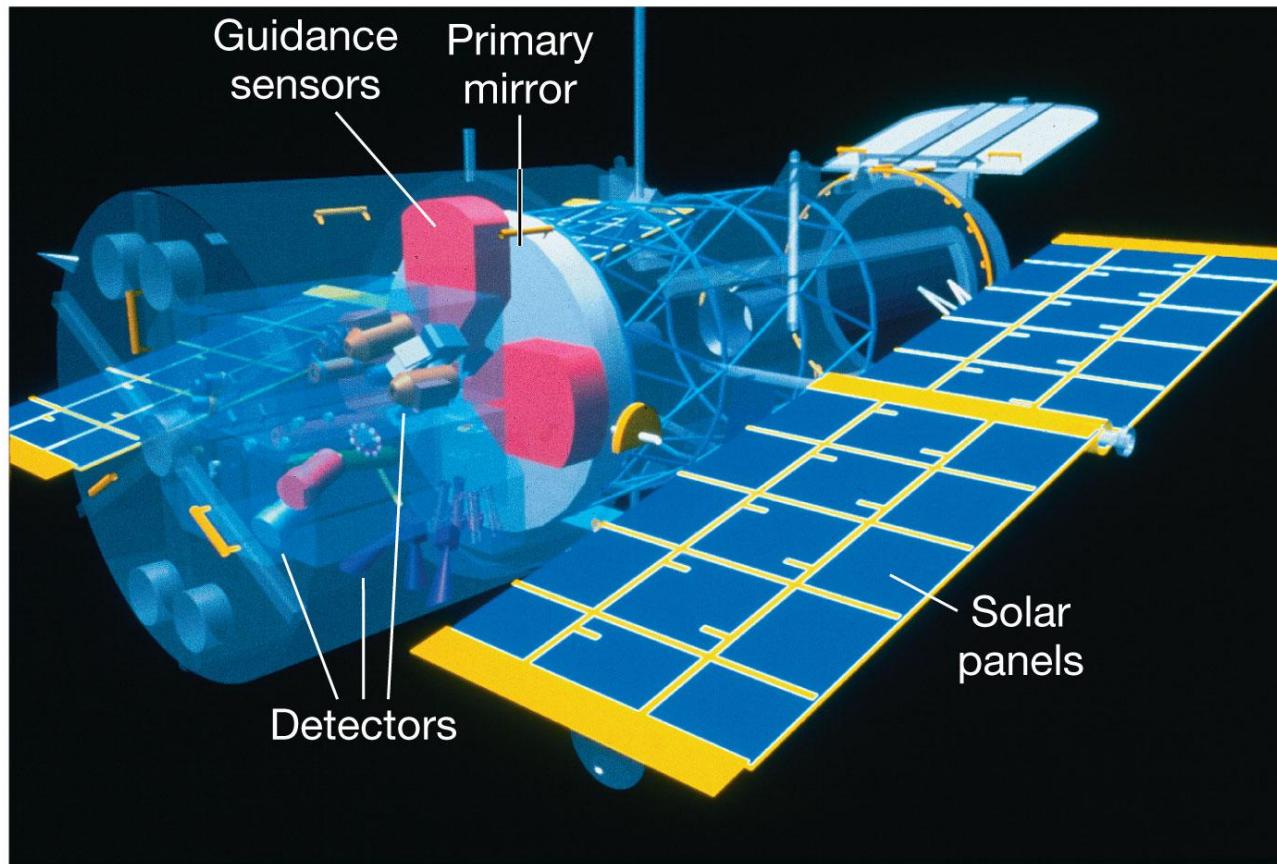

## The Keck telescope, a modern research telescope

© 2011 Pearson Education, Inc.

# Discovery 5-1: The *Hubble Space Telescope*

The *Hubble Space Telescope* has a variety of detectors

© 2011 Pearson Education, Inc.

# Discovery 5-1: The *Hubble Space Telescope*

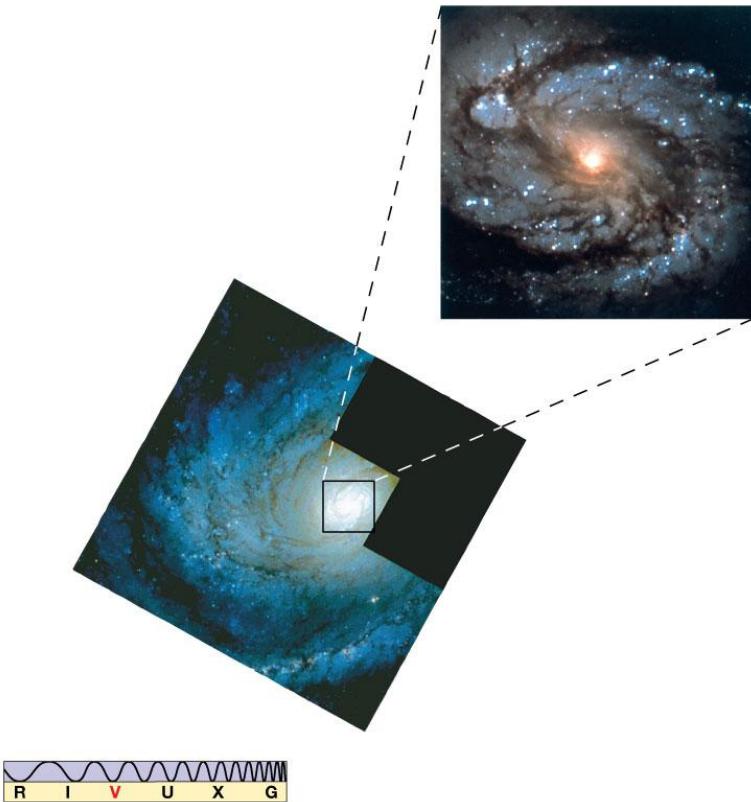

The *Hubble Space Telescope's* main mirror is 2.4 m in diameter and is designed for visible, infrared, and ultraviolet radiation

© 2011 Pearson Education, Inc.

# Discovery 5-1: The *Hubble Space Telescope*

Here we compare the best ground-based image of M100, on the left, with the *Hubble* images on the right

© 2011 Pearson Education, Inc.

# 5.2 Telescope Size

**Light-gathering power: Improves detail**

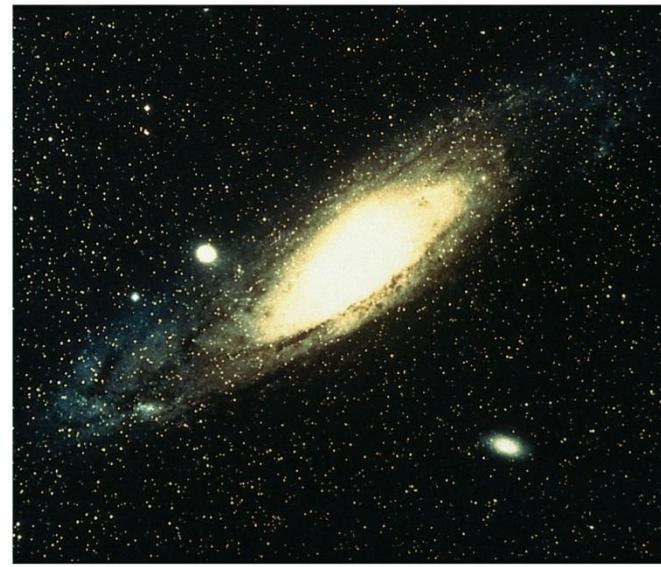

**Brightness proportional to square of radius of mirror**

**Photo (b) was taken with a telescope twice the size of the telescope that took photo (a)**

(a)

© 2011 Pearson Education, Inc.

(b)

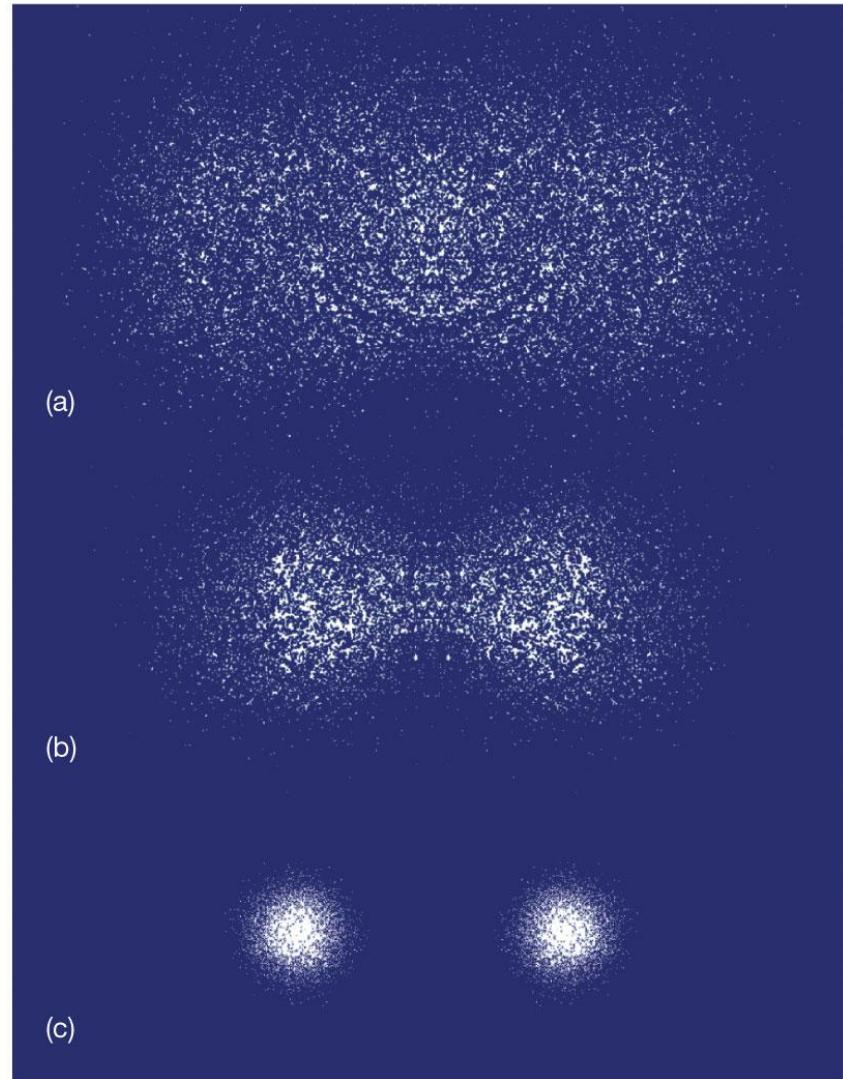

© 2011 Pearson Education, Inc.

# 5.2 Telescope Size

**Resolving power:** When better, can distinguish objects that are closer together

Resolution is proportional to wavelength and inversely proportional to telescope size—bigger is better!

# 5.2 Telescope Size

Effect of improving resolution:

(a) 10'; (b) 1'; (c) 5"; (d) 1"

# 5.3 Images and Detectors

**Image acquisition:** Charge-coupled devices (CCDs) are electronic devices, which can be quickly read out and reset

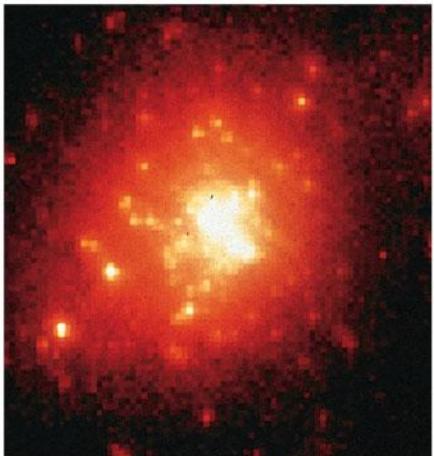

# 5.3 Images and Detectors

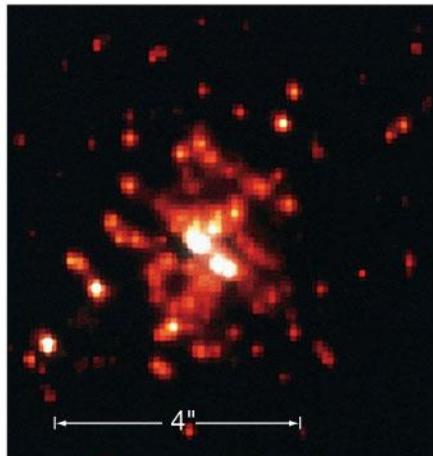

Image processing by computers can sharpen images

# 5.4 High-Resolution Astronomy

## Atmospheric blurring is due to air movements

# 5.4 High-Resolution Astronomy

## Solutions:

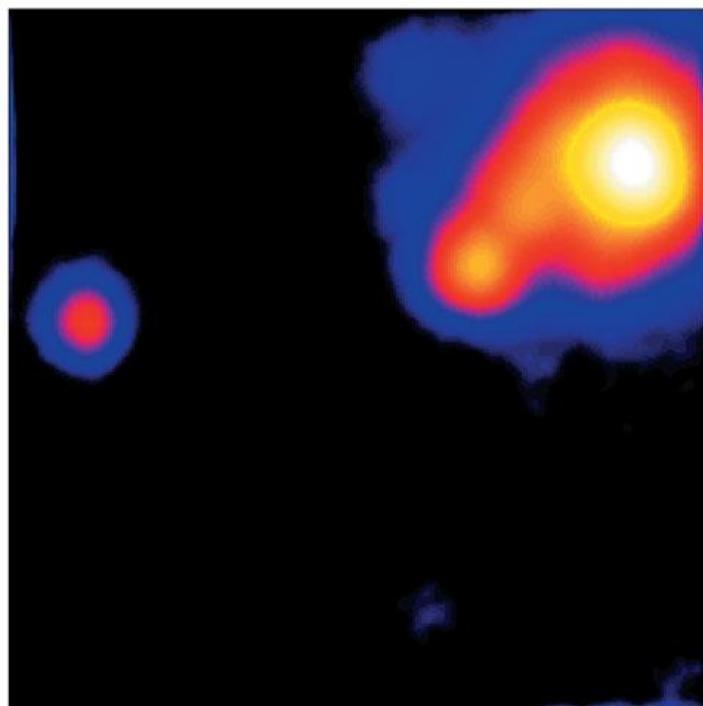

- Put telescopes on mountaintops, especially in deserts
- Put telescopes in space

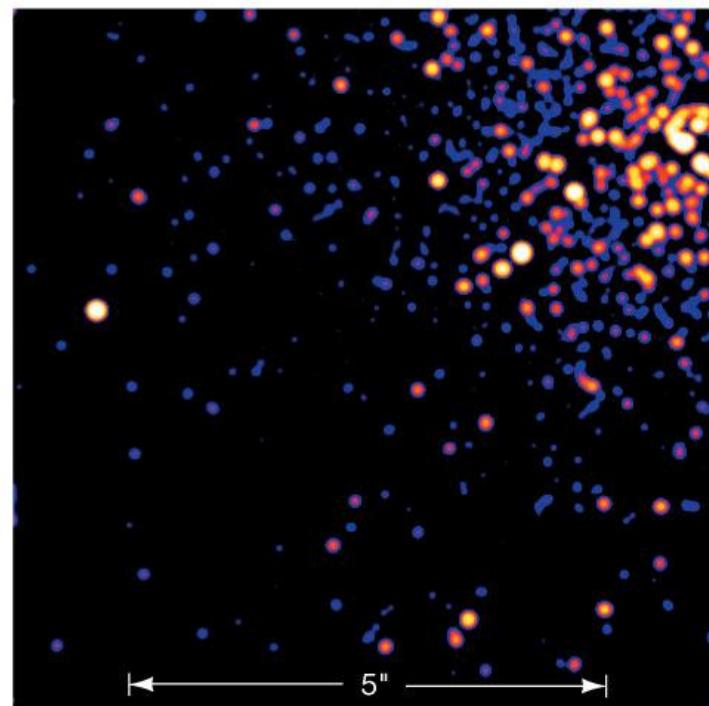

© 2011 Pearson Education, Inc.

# 5.4 High-Resolution Astronomy

**Active optics: Control mirrors based on temperature and orientation**

(a)

(b)

# 5.4 High-Resolution Astronomy

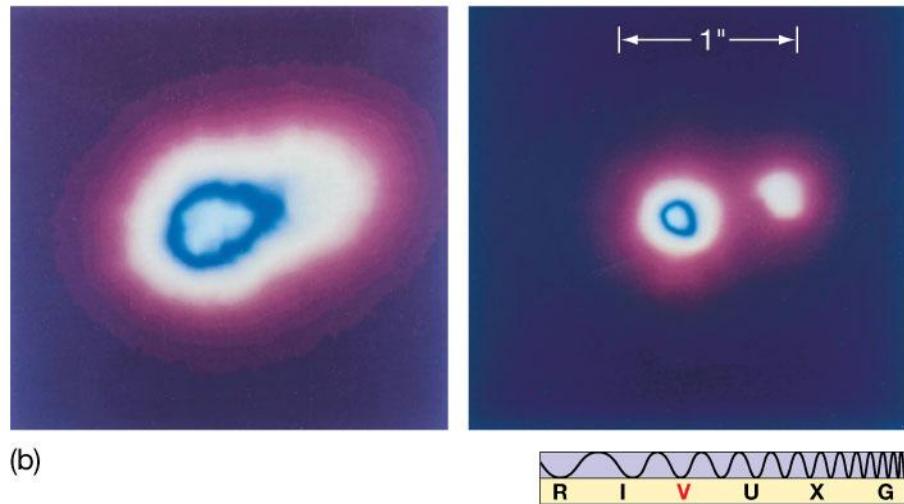

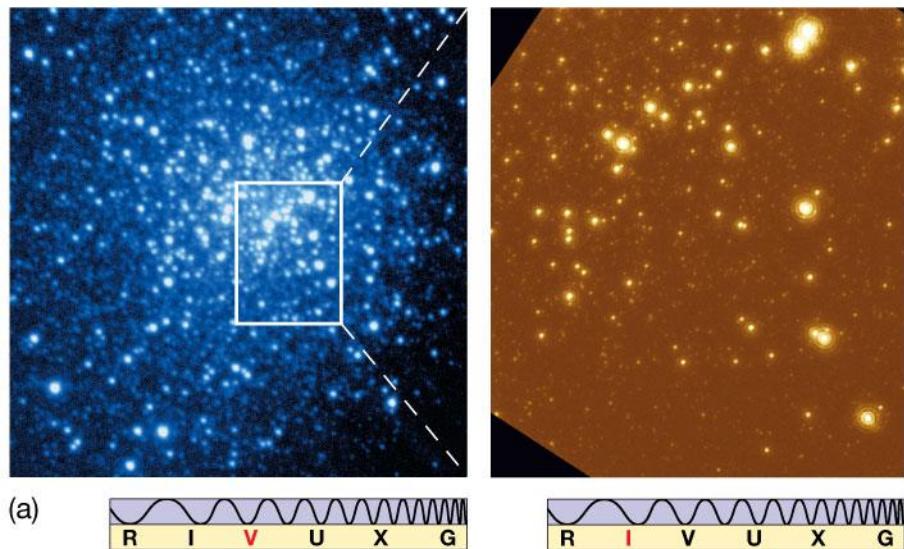

**Adaptive optics:** Track atmospheric changes with laser; adjust mirrors in real time

© 2011 Pearson Education, Inc.

# 5.4 High-Resolution Astronomy

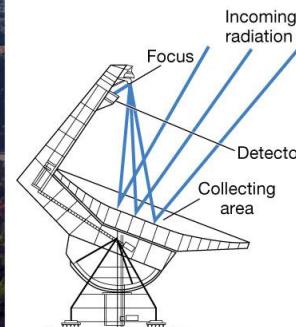

These images show the improvements possible with adaptive optics

# 5.5 Radio Astronomy

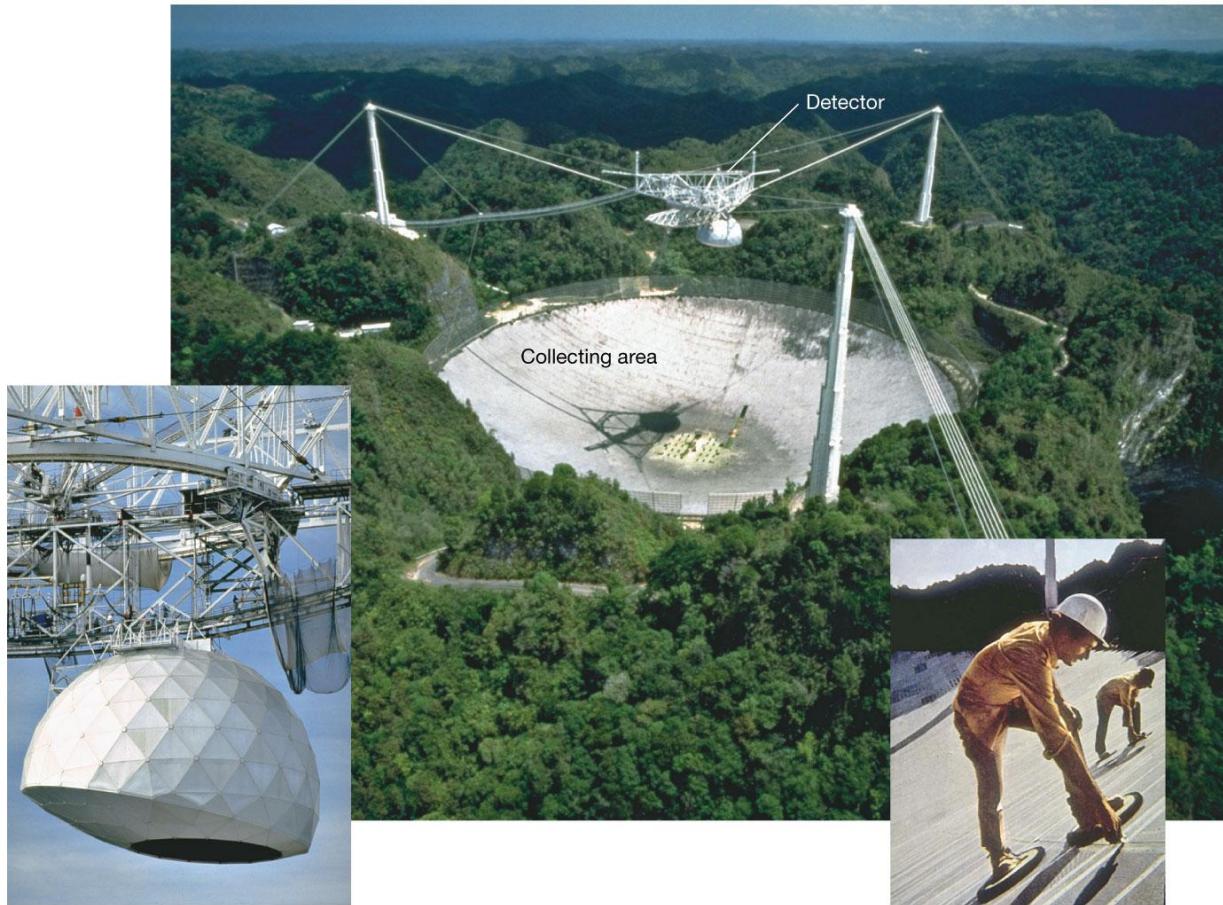

## Radio telescopes

- Similar to optical reflecting telescopes
- Prime focus
- Less sensitive to imperfections (due to longer wavelength); can be made very large

# 5.5 Radio Astronomy

Largest radio telescope is the 300-m dish at Arecibo

© 2011 Pearson Education, Inc.

# 5.5 Radio Astronomy

**Longer wavelength means poor angular resolution**

**Advantages of radio astronomy:**

- **Can observe 24 hours a day**
- **Clouds, rain, and snow don't interfere**
- **Observations at an entirely different frequency; get totally different information**

# 5.6 Interferometry

## Interferometry:

- Combines information from several widely spread radio telescopes as if it came from a single dish
- Resolution will be that of dish whose diameter = largest separation between dishes

(a)

© 2011 Pearson Education, Inc.

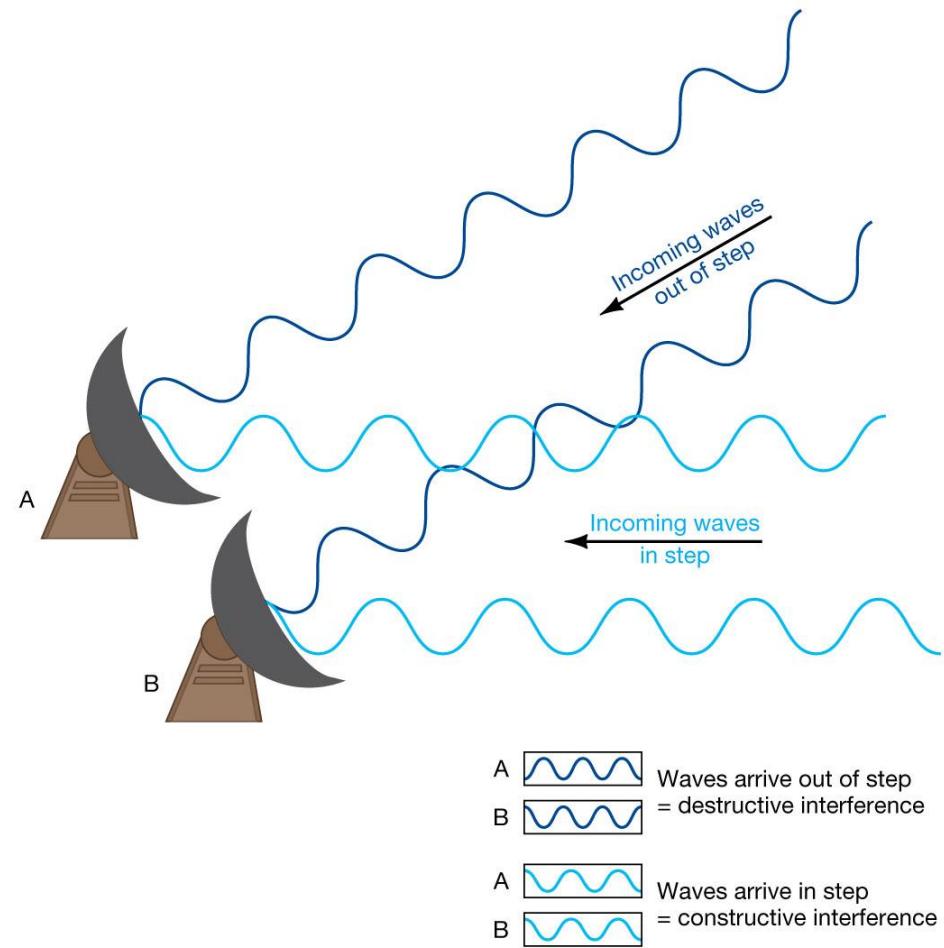

(b)

© 2011 Pearson Education, Inc.

# 5.6 Interferometry

Interferometry involves combining signals from two receivers; the amount of interference depends on the direction of the signal

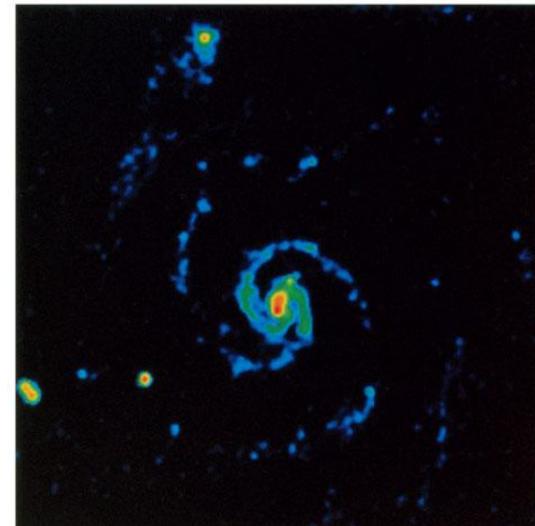

© 2011 Pearson Education, Inc.

# 5.6 Interferometry

Can get radio images whose resolution is close to optical

Interferometry can also be done with visible light but is much more difficult due to shorter wavelengths

(a)

(b)

# 5.7 Space-Based Astronomy

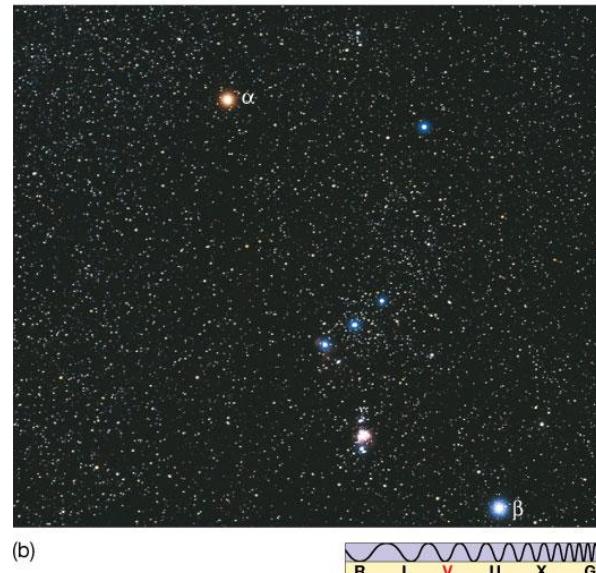

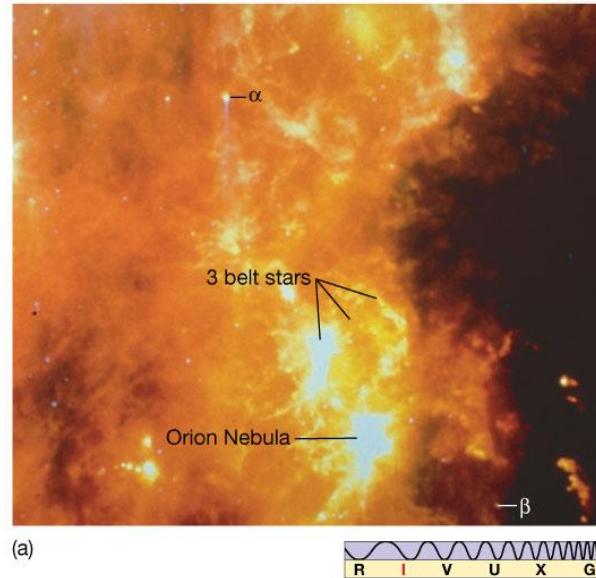

Infrared radiation can produce an image where visible radiation is blocked; generally can use optical telescope mirrors and lenses

© 2011 Pearson Education, Inc.

# 5.7 Space-Based Astronomy

Infrared telescopes  
can also be in space;  
the image on the top  
is from the Infrared  
Astronomy Satellite

# 5.7 Space-Based Astronomy

The *Spitzer Space Telescope*, an infrared telescope, is in orbit around the Sun. These are some of its images.

(a)

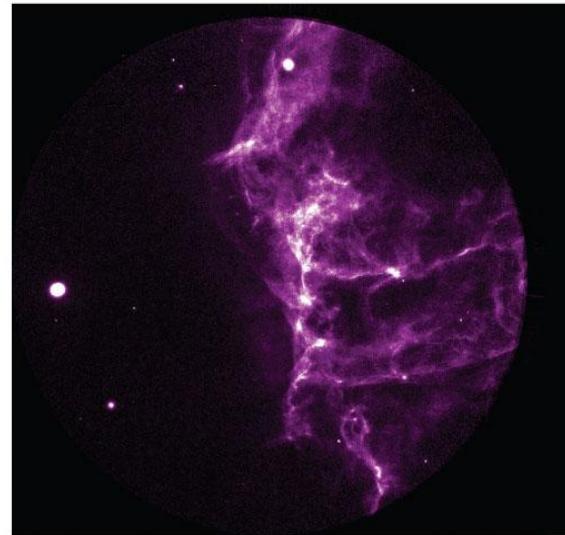

(b)

# 5.7 Space-Based Astronomy

**Ultraviolet observing  
must be done in space,  
as the atmosphere  
absorbs almost all  
ultraviolet rays.**

(a)

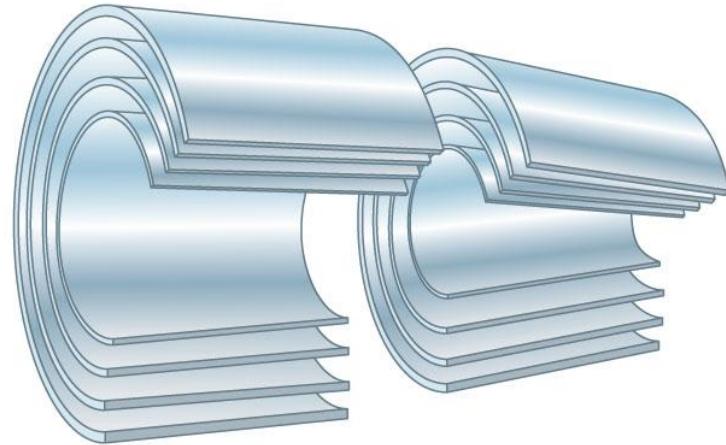

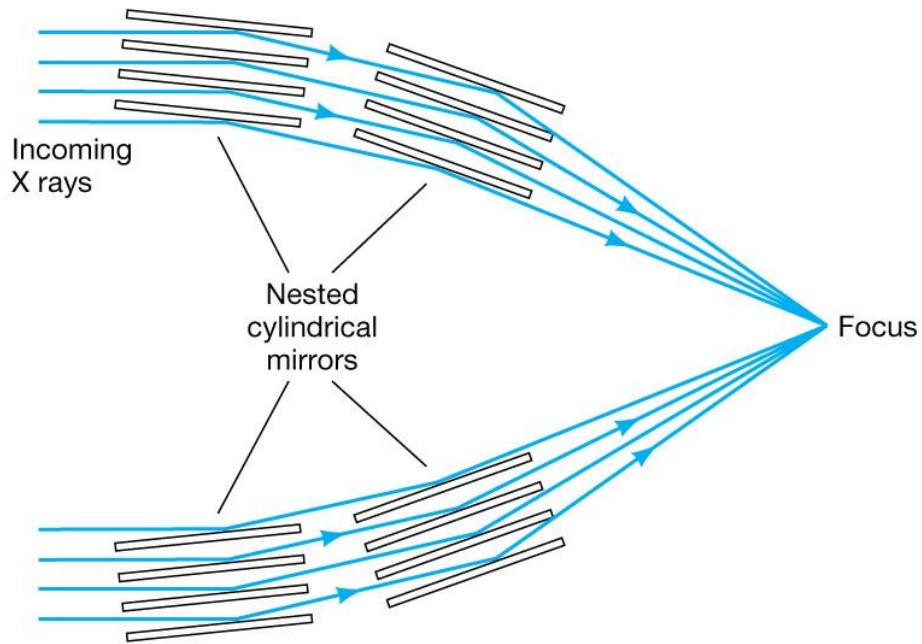

(b)

# 5.7 Space-Based Astronomy

X rays and gamma rays will not reflect off mirrors as other wavelengths do; need new techniques

X rays will reflect at a very shallow angle and can therefore be focused

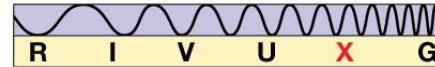

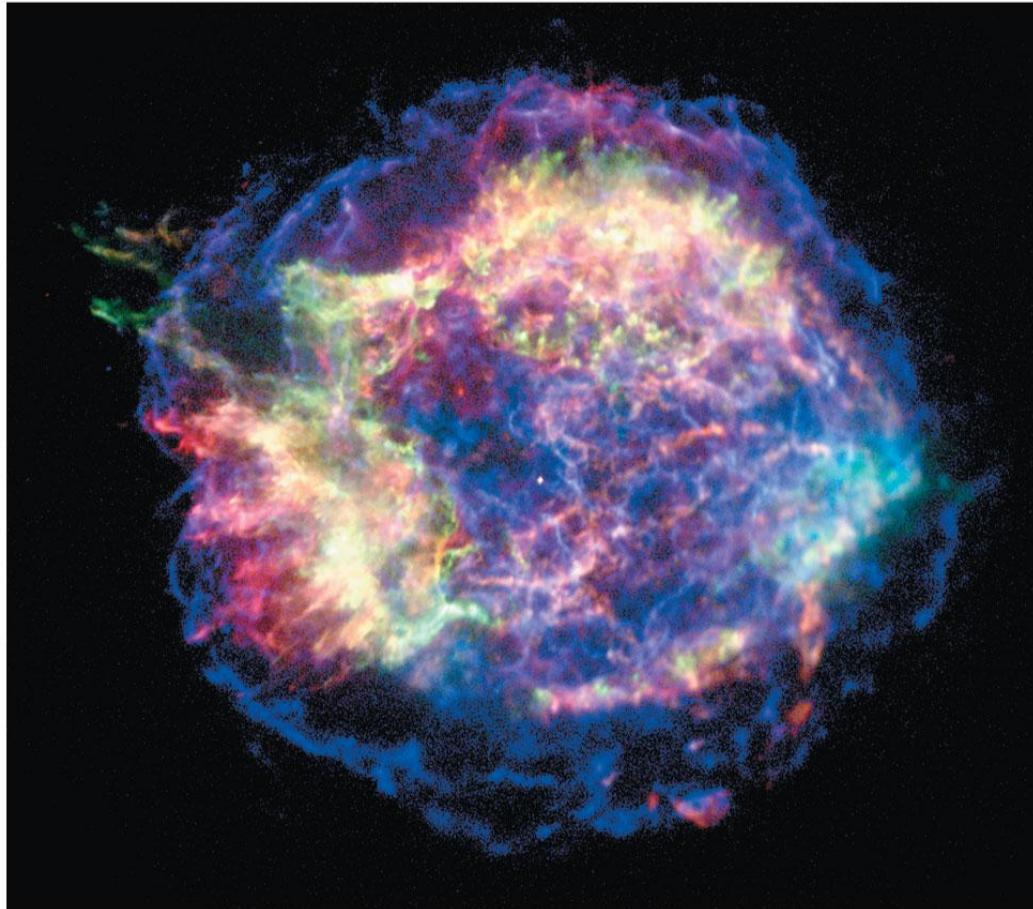

(a)

(b)

© 2011 Pearson Education, Inc.

# 5.7 Space-Based Astronomy

## X-ray image of supernova remnant

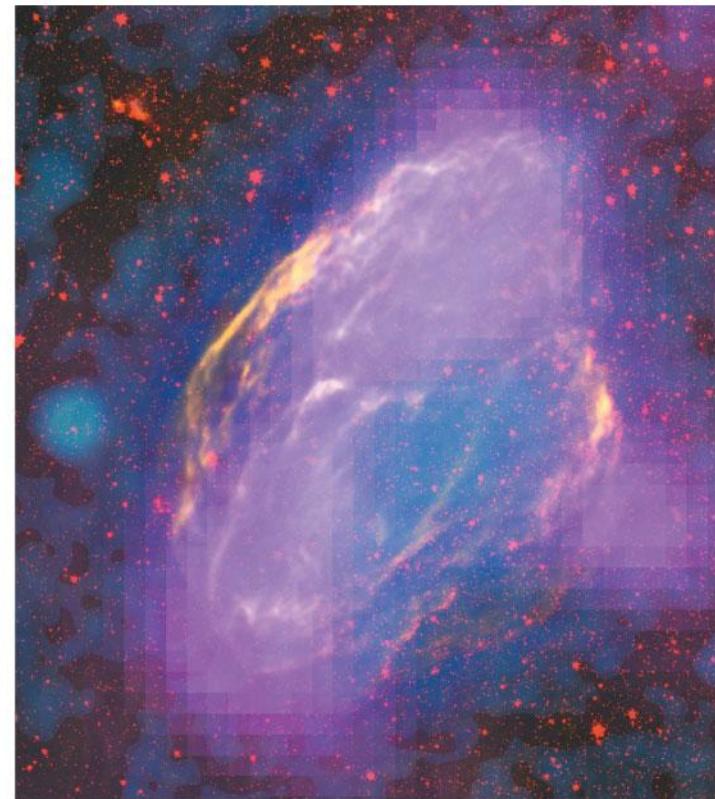

© 2011 Pearson Education, Inc.

# 5.7 Space-Based Astronomy

**Gamma rays cannot be focused at all; images are therefore coarse**

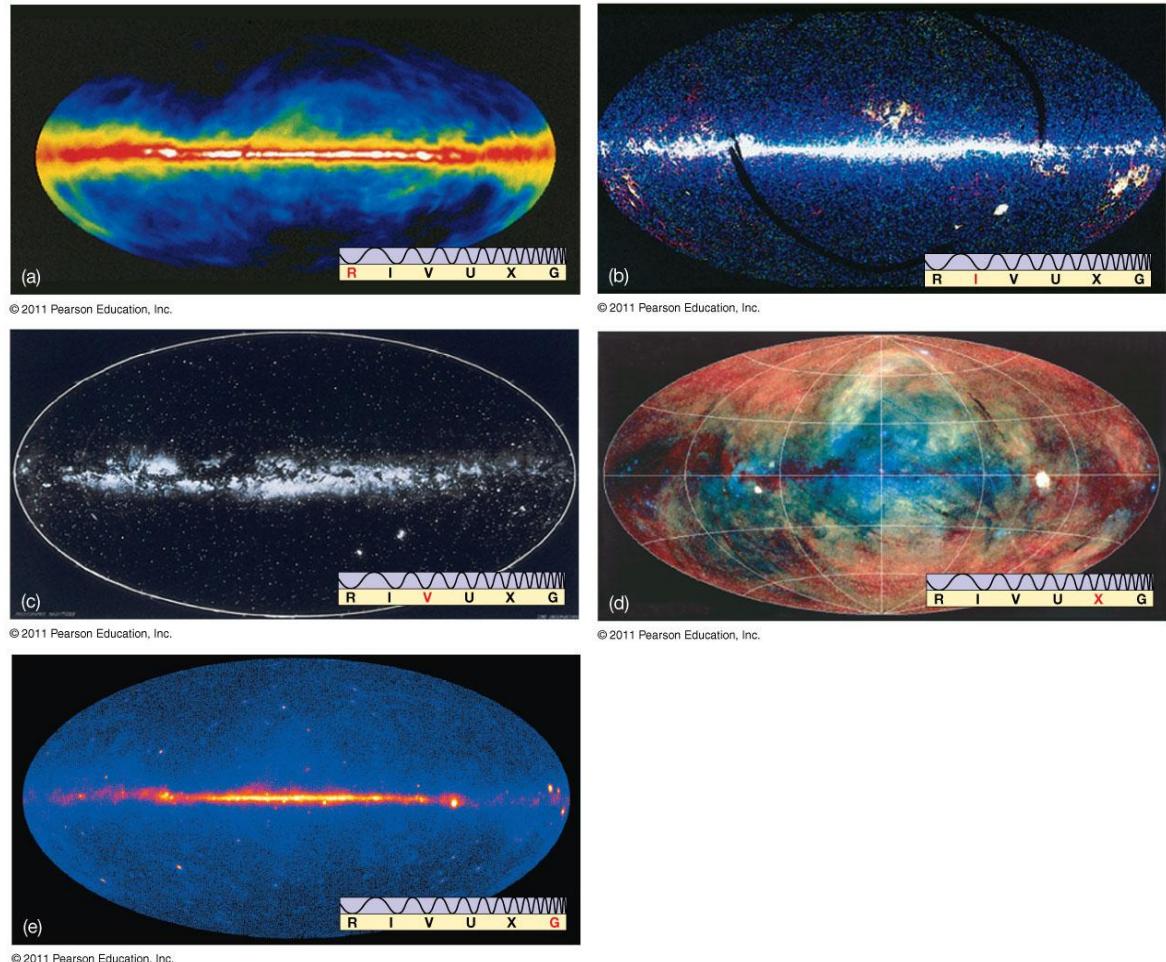

(a)

(b)

# 5.8 Full-Spectrum Coverage

Much can be learned from observing the same astronomical object at many wavelengths. Here is the Milky Way.

# Summary of Chapter 5

- Refracting telescopes make images with a lens
- Reflecting telescopes make images with a mirror
- Modern research telescopes are all reflectors
- CCDs are used for data collection
  - Data can be formed into image, analyzed spectroscopically, or used to measure intensity
- Large telescopes gather much more light, allowing study of very faint sources
- Large telescopes also have better resolution

# Summary of Chapter 5 (cont.)

- Resolution of ground-based optical telescopes is limited by atmospheric effects
- Resolution of radio or space-based telescopes is limited by diffraction
- Active and adaptive optics can minimize atmospheric effects
- Radio telescopes need large collection area; diffraction limited
- Interferometry can greatly improve resolution

# Summary of Chapter 5 (cont.)

- **Infrared and ultraviolet telescopes are similar to optical**
- **Ultraviolet telescopes must be above atmosphere**
- **X rays can be focused, but very differently than visible light**
- **Gamma rays can be detected but not imaged**
